

# README — JD Anki Glass Card System

---

This package contains the working reference setup for the JD glassmorphic Anki card system.

It currently supports:

**Basic cards** with `Front` and `Back` fields.

**Cloze cards** with `Text` and `Extra` fields.

Animated glass styling, media support, screenshots, diagrams, AI-generated explanations, and future Noctyrium integration.

# 1. Import the Reference File

Download and open:

**Test.apkg**

This imports one working reference card.

After import:

Open **Browse**.

Find the imported card.

Suspend it or move it into a reference deck.

Keep it as a working example for media, styling, and note type setup.

Do not delete it until your own copied note types work.

## 2. Important Field Rules

The templates only work with the correct note type fields.

Basic requires:

**Front**

**Back**

Cloze requires:

**Text**

**Extra**

If field names do not match, the card may render blank or break.

Do not paste Cloze templates into Basic note types.

Do not paste Basic templates into Cloze note types.

### 3. Best Setup Path

Import **Test.apkg**.

Open **Browse**.

Select the imported card.

Open its note type/card templates.

Duplicate the note type.

Rename the duplicate.

Suggested names:

**JD Glass Basic — Custom**

**JD Glass Cloze — Custom**

**JD       Basic**

**JD       Cloze**

Edit only the duplicate. Keep the original as a fallback.

## 4. Make a New Basic Card Type

Open Anki.

Go to **Tools → Manage Note Types → Add**.

Choose a Basic-style note type.

Rename it **JD Glass Basic**.

Make sure the fields are:

**Front**

**Back**

Open **Cards**.

Paste:

Basic Front code into **Front Template**.

Basic Back code into **Back Template**.

Basic CSS into **Styling**.

Save and preview.

## 5. Make a New Cloze Card Type

Open Anki.

Go to **Tools → Manage Note Types → Add**.

Choose a Cloze-style note type.

Rename it **JD Glass Cloze**.

Make sure the fields are:

**Text**

**Extra**

Open **Cards**.

Paste:

Cloze Front code into **Front Template**.

Cloze Back code into **Back Template**.

Cloze CSS into **Styling**.

Save and preview.

## 6. Reuse or Update Existing Decks

Before editing, export a backup `.apkg`.

Then:

Open **Browse**.

Select a card from the deck.

Check whether it is Basic or Cloze.

Open **Cards**.

Paste only the matching template code.

Preview several cards before continuing.

Basic deck = Basic templates only.

Cloze deck = Cloze templates only.

## 7. Add Images or Media

Use Anki's editor to insert images directly into the fields.

Basic:

**Front** = question image or prompt.

**Back** = answer image, explanation, or diagram.

Cloze:

**Text** = recall prompt or cloze sentence.

**Extra** = explanation, screenshot, or diagram.

The CSS automatically centers and scales images inside the glass card.

## 8. Sharing Folder Structure

Recommended package layout:

**README.md**

**Test.apkg**

**Basic Front Template.txt**

**Basic Back Template.txt**

**Basic CSS.css**

**Cloze Front Template.txt**

**Cloze Back Template.txt**

**Cloze CSS.css**

**Screenshots**

**Screen Recordings**

The `.apkg` is the working example.

The text/CSS files are the editable source.

Screenshots and recordings show expected behavior.

## 9. Noctyrium Integration Direction

This card system is currently standalone.

Future Noctyrium support may allow:

Automatic card generation from lecture slides.

Automatic routing into the right deck.

Automatic note type selection.

Automatic tagging by course, lecture, topic, and source.

Screenshot-based card generation.

AI-generated Basic and Cloze cards.

Future IO, reverse, and PQ card formats.

## 10. Current Status

Working now:

Basic card template.

Cloze card template.

Glass styling.

Animations.

Desktop cursor-reactive motion.

Mobile fallback.

Media and screenshot display.

Single-card `.apkg` reference file.

Not built yet:

Noctyrium auto-loading.

Lecture-slide-to-card automation.

Image Occlusion version.

Reverse card version.

Full deck-generation pipeline.
