

ER IMG & LAB

St. George's University

General Information

The images listed below will assist you in preparing for the lab session. Use these and compare them with the images provided in this document. Be sure that you are able to answer the questions of all stations before coming to the scheduled lab session. The links to the videos associated with each station are provided below. Use this document as a guide to the structures, images and clinical concepts necessary for your examination.

Available in the Gray's Clinical Dissector

Chapter 14: Pelvis and Perineum pg. 242-253:

14.9, 14.10, 14.11, 14.14, 14.15, 14.16, 14.21, 14.23, 14.24

Chapter 15: Perineum pg. 255-267:

15.1, 15.2, 15.3, 15.4, 15.5, 15.6, 15.7, 15.8, 15.10, 15.11, 15.12, 15.13, 15.15, 15.18, 15.22

Available in the McMinn's & Abrahams' Clinical Atlas of Human Anatomy:

Chapter 5: Abdomen and Pelvis:

278A&B, 279, 281A&B, 282A&B, 283, 285, 287A&B, 289A

Male Pelvis

- Identify the major organs in the male pelvis and their relationship to each other
- Identify the ductus deferens, seminal vesicles and prostate
- Discuss the relationship between these structures and the bladder
- Identify the blood vessels that supply the prostate gland
- Identify the corpus cavernosum, corpus spongiosum
- Trace the urethra from the neck of the bladder to the tip of the glans penis and identify the different parts (preprostatic, prostatic, membranous, spongy)
- During insertion of the catheter at which point may the physician meet some resistance and why?

Male Pelvis

- Identify the structures labeled 1-3
- Where would these structures empty?
- Describe the anatomical relationship between the structures identified above
- Discuss the pathway sperm takes from the seminiferous tubules to ovum?

Male Perineum

- Identify the ischiocavernosus muscle, bulbospongiosus muscle, crura and the bulb of the penis, glans and prepuce (foreskin)
- Identify the scrotum, testes, and penis
- Discuss which lymph nodes the testes drain into and relate this to their embryonic origin
- Recall the layers of the abdominal wall that contribute to the formation of the layers of the spermatic cord
- Name and try to identify as much of the contents of the spermatic cord
- Discuss the fascial coverings of the penis and its clinical importance
- Discuss the type of innervation required for erection and ejaculation respectively

Female Pelvis

- Identify: uterus, cervix, vagina, anterior fornix, posterior fornix, uterine tubes, ovaries
- Describe the relationship between the uterus, bladder and rectum, and the pouches created by the peritoneum that folds over them
- Discuss the normal position of the uterus, what would be the consequence of a uterus that is in another position?
- Identify the broad, proper ovarian, round, and suspensory ligaments
- Discuss the process of ovulation and describe how the ovum travels to and through the uterine tube
- Discuss where fertilization and implantation takes place respectively
- Discuss the possible reasons for ectopic pregnancy
- Identify the blood supply to the female pelvic organs
- Identify the urethra and discuss the reason why females are more prone to urinary tract infection

This image shows a hysterosalpingogram (contrast material injected via the cervix into the uterus)

- What is the purpose of the procedure? Which other less invasive tests should be done prior to this procedure?
- Identify structures 1 & 2 indicated on the image.
- Insertion of the catheter into the cervix is accompanied by pain radiating along the perineum. Describe the pelvic pain line and its relation to the uterus.
- Assuming that the reproductive tract is patent, where will the injected fluid accumulate?
- What is the most common location for ectopic pregnancy? Discuss the reason.
- Why is a hysterosalpingogram in cases an investigation and a therapeutic intervention?

Female Perineum

- Identify mons pubis, labia majora, labia minora, vestibule, clitoris
- Discuss the innervation and lymphatic drainage of these structures
- Discuss the reason for performing an episiotomy during labor and where it would ideally be placed
- Discuss and identify the boundaries of the ischioanal fossa
- Identify the contents of the fossa and discuss the distribution of each
- Discuss the boundaries and content of pudendal canal
- Discuss the significance of the sacrospinal ligament to pudendal nerve block
